Conclusions In this paper, we have shown the design, implementation, and testing of a MIMO controller to actively damp tower s-s and f-a motion by using generator torque and blade pitch in Region 2. Generator torque effectively damps tower s-s motion; blade pitch effectively damps tower f-a motion. When combined together in a MIMO controller, they actively damp both motions simultaneously without destabilizing the turbine. We described the steps taken to implement this MIMO controller. We resolved issues of accelerometer response at high vibration frequencies. We included filter states in the control model so the controller could compensate for the phase lag produced when the tower-top accelerometer data is filtered before using it as an input to the controller. Another issue was the excitation of unmodeled dynamics at 38. 5 rpm rotor speed. We resolved this problem by designing a second controller with reduced tower damping gains and scheduling this controller to operate between 38 and 39 rpm. In future work we will design a filter to correctly attenuate accelerometer response at this frequency without affecting response at the tower first s-s and f-a natural frequencies. Results from the MIMO controller showed large reductions in tower s-s and f-a bending moments compared to the baseline controller without the tower avoidance scheme. The MIMO controller produced similar tower s-s load alleviation but greater tower...
